One motif. Three legitimate jobs.

Same six photographs. Same phone canvas. Different selection meanings.

A · Photograph

One dominant reel. A photo is selected, then applied separately.

B · Collection → Photo

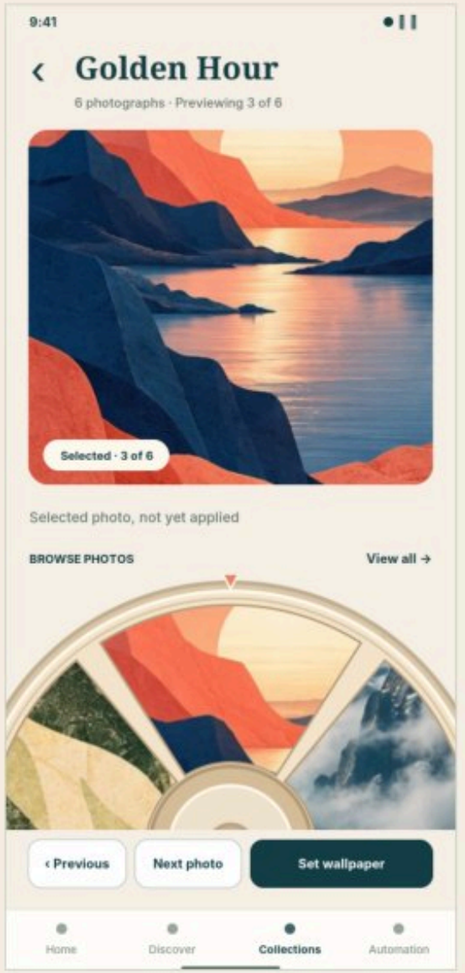

Smaller parent reel changes the child photo set. Neither applies wallpaper.

C · Home ↔ Lock

Distinct destination previews. One active wheel on a compact phone.

Does the second reel earn its pixels?

Both show Golden Hour, photo 3 of 6, with precisely the same six fixture photographs.

A: single photo reel (baseline)

Large hero; simple hierarchy; conventional collection switching. Best use of compact screen space. The reel has one meaning: browse photographs.

B: Collection → Photo (candidate)

Offers a tactile parent selection, but competes with hero height and swipe comfort. It only wins if switching collections is frequent enough to justify the space.

Verdict: prototype B against A, do not replace A by assumption.

Two reels, two IDs, no accidental wallpaper change.

An asymmetrical visual arrangement is legitimate o

01

1 / Parent reel

CollectionId: Golden Hour

↓

02

2 / Child photos

ImageAssetId: selected image

↓

03

3 / Main preview

Same ImageAssetId as child focus

↓

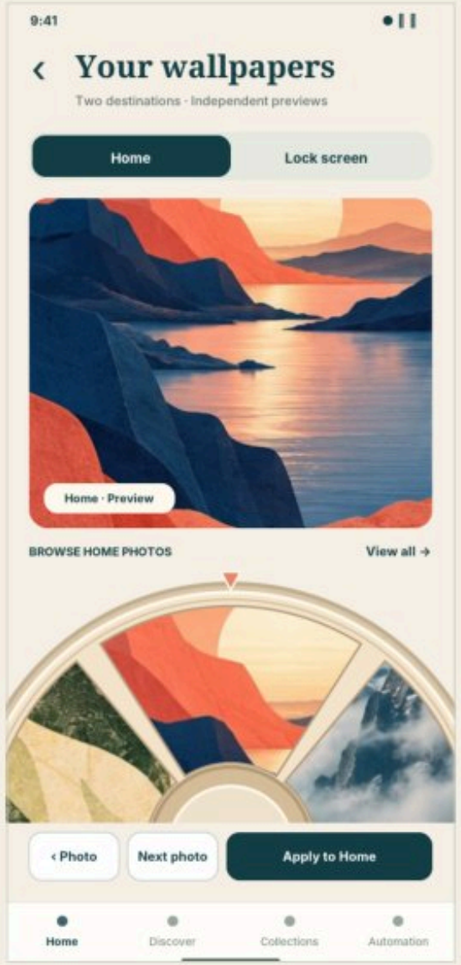

04

4 / Apply boundary

Explicit Set wallpaper + target

Two destinations. One active reel on a phone.

Home and Lock have separate preview IDs, but the user must not lose hero prominence.

C0: destination tabs (control)

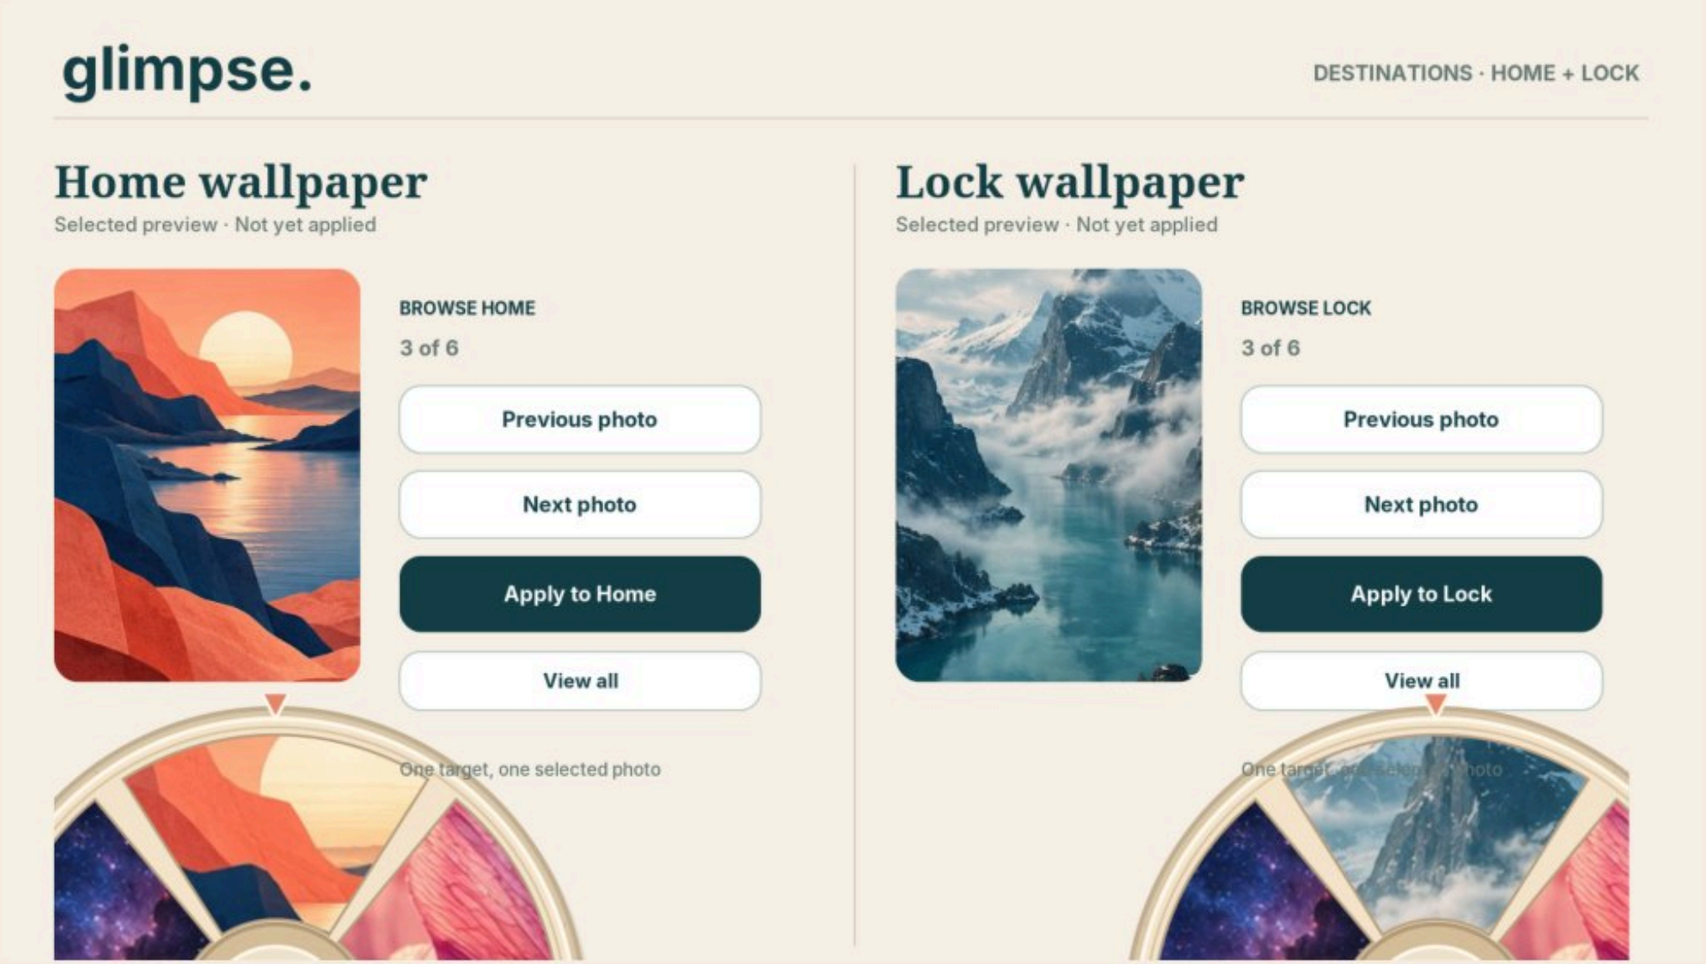

Unambiguous selection, full hero photograph, no duplicate wheel costs. A strong compact-phone baseline.

C1: paired preview (candidate)

The secondary destination is shown as a compact preview and explicit Edit Lock action. A full second rotating wheel would crowd the primary controls.

Wide windows can support two genuinely independent reels.

On tablets or landscape, two destination choices become legible without shrinking buttons.

Asymmetry: opposite lower arcs; separation: no shared hitbox.

Home selector

Own ImageAssetId, image preview, Browse and Apply Home. No coupling to Lock unless user explicitly links selections.

Lock selector

Same fixture set, separate state, separate result. If Android cannot set Lock independently, say so and disable apply.

The second reel should be the first thing to disappear.

Compact and large-text layouts preserve one useful wheel plus ordinary named controls.

Choose collection is a legitimate fallback

When available height, text scale or insets make two reels cramped, replace the parent with a labeled collection selector. Keep selection semantics exactly the same.

What must never collapse

Image identity; Previous / Next photo; View all; explicit Apply destination; OS insets; accessibility semantics. Those are more important than the paper object.

Where the reel helps, and where it becomes theatre.

Question each interaction from the human goal backward to the exact state changed.

DO / Photo reel

Browse neighboring photos; focus changes preview only.

TEST / Collection reel

Switch named collections; child reel rebinds; rotation unchanged.

TEST / Destination pair

Compare Home and Lock with independently applied outcomes.

MAYBE / Variant reel

Compare 3–7 alternate crop recipes, not numeric crop controls.

NO / General settings

Switches, percentages, permissions, priority and time use native controls.

NO / Fake infinity

Show real count and endpoints; five visible holes are not five items.

Start with the simple reel. Earn the second.

Design decisions can remain playful without demanding more animation or navigation.

01

Default now: one large Photo reel

Strongest match for browsing; leaves room for hero, Grid and explicit Set wallpaper.

02

Experiment: Collection → Photo

Genuine hierarchical selector; compare against a normal collection chooser.

03

Destination view: tabs first, paired reels on wide

Keep two independent preview/application states; promote dual reels only if easier to use.
